This Event is brought to you for free and open access by the Conferences and Symposia at NEIU Digital Commons. It has been accepted for inclusion in NEIU Student Research and Creative Activities Symposium by an authorized administrator of NEIU Digital Commons. For more information, please contact [neiudc@neiu.edu](mailto:neiudc@neiu.edu).

# **PERCEPTIONS OF PHYSICAL ACTIVITY AND ENGAGEMENT AMONG LATINX COLLEGE STUDENTS**

Gabriela Carmona

Department of Psychology, Northeastern Illinois University, Chicago, IL 60625

Physical activity among the Latinx community is insufficient. According to the Centers for Disease Control and Prevention (2015), 1 in 6 people residing in the US are Hispanic. The Latinx population is rapidly increasing; therefore, it is vital to understand their health care needs. Specific health problems are prevalent at a much higher rate among the Latinx population. The Centers for Disease Control (2015) state that the Latinx community is about 50% more likely to die from diabetes and other lifelong illnesses as opposed to Caucasians. College is a time when lifelong health patterns are established; students must develop healthier routines to maintain overall good health throughout their life. Despite a lack of studies on Latinx college students' physical activity, existing studies have indicated that Hispanics' ethnic-specific attitudes have contributed to their lack of physical activity engagement. Self-efficacy has been identified as a predictor of exercise adherence within the social cognitive theory; however, its applicability is limited within the Latinx community (McAuley & Blissmer, 2000). The purpose of the present study is to use the social-cognitive theory to explain the lack of physical activity among Latinx college students. This mixed-methods study will examine perceptions of physical activity and fitness among college students. These findings will provide a tailored and targeted direction for future health care practice and research to increase physical activity among the Latinx population. Preliminary data shows that 51% of all participants are currently not physically active but would like to be soon.
